

Ataree - eBPF-based Monitoring Tool

This is a project that uses a the ebpf virtual machine to hook programs in kernel space to common syscalls...etc. These events will be directed to userland for processing using Golang.

Backlog (things we should work on)

1. □ Initialize Go module and project structure (cmd/, internal/).
2. □ Add cilium/ebpf dependency.
3. □ Write minimal eBPF C program (tracepoint sys_enter_execve).
4. □ Define shared event struct (C + Go).
5. □ Compile eBPF program to .o.
6. □ Load eBPF object in Go.
7. □ Attach program to tracepoint.
8. □ Create ring buffer reader.
9. □ Parse events and print PID + command.
10. □ Implement graceful shutdown (SIGINT handling).

That's Sprint 1. Other stuff would have to wait.

Docs (that's a bonus)

As the project progresses, check the docs for more info: <https://hxuu.github.io/ataree/>
